

Install on macOS

Generated on August 15, 2026

Download

Download the DMG from the [download page](#) and verify its published SHA-256 checksum.

Installing

1. Open the DMG and drag **Data Orchestrator** into `/Applications`.
2. On first launch, macOS Gatekeeper will refuse to open an app from an unidentified developer unless it is notarized. If the build you downloaded is notarized, a normal double-click works. If not, right-click the app, choose **Open**, and confirm the dialog once — this is only needed the first time.
3. The installer registers a `launchd` agent so Data Orchestrator starts on login (or at boot, for a headless server install) without needing the app to stay open in the foreground.

Logs

Application logs live under `~/Library/Logs/DataOrchestrator/` for a per-user install, or under `/var/log/` for a `launchd` daemon-style install. See the [configuration reference](#) for where the engine's own `entities/` / `logs/` / `loggers/` directories live.

Uninstalling

See [Uninstalling](#) — removing the `launchd` agent and the application bundle does not remove your data.
